## 1. INTRODUCTION

Baird AE has been retained to prepare a Traffic Impact Study in support of the residential condominium development in the Municipality of Chatham-Kent. The site is approximately 0.92 ha (2.29 ac) in size and bounded by golf course to the west, Indian Creek Road West to the north, and agricultural land to the south and existing residential development to the east.

The proposed development will consist of 9-storey building with 87 dwelling units parking area, loading dock and landscape. The site will generate an additional 579 daily, 44 morning peak and 54 evening peak traffic. The development is shown in Exhibit 1 below.

Exhibit 1 - Location Map

### 1.1 Study Purpose and Scope

This study was completed in support of a development application and to assess the traffic impacts/mitigation requirements associated with the proposed development. The development is projected to be built by 2025 and as a result, the following future horizon periods (conditions) were established as part of this study:

- 2025 Future Condition; and
- 2035 Long Term Future Condition.

The intersections that were analyzed were determined through coordination with the Municipality of Chatham-Kent and consist of the following existing intersections:

- Indian Creek Road West and Lacroix Street; and
- Indian Creek Road West and Charing Cross Road/Queen Street.

## ***1.2 Analysis Methodology***

A transportation analysis was completed to determine the existing and future operating conditions of the intersection and the individual turning movements. The operational analyses were primarily based on procedures set out in the Highway Capacity Manual (2010) with the assistance of Synchro 10. Several performance measures are used in the analysis of signalized and unsignalized intersections, including:

- Level of Service (LOS) – a measure of the average vehicle delay experienced by the motorists attempting to travel through the intersection. LOS is measured from “A” to “F” with peak hour LOS in the “A” to “D” range being considered acceptable by most and a LOS of F representing unacceptable delays;
- Delay – the additional travel time experienced by a driver compared to free-flow conditions; and
- Queue Lengths – the Synchro Software measures both the 50th percentile and 95th percentile maximum queue lengths. The 50th percentile queue (the median) is the maximum back of queue length during a typical traffic cycle. The 95th percentile queue is the maximum back of queue length during a typical traffic cycle with 95th percentile traffic volumes. The 95th percentile queue measures the queue length that 95 percent of the sample lies below. The 95th percentile critical queue lengths were identified for movements where the queue surpassed the estimated length of the storage bay.

Taken together, these measures provide an indication of delay and the number of vehicles that can be accommodated through an intersection.

## **2.0 EXISTING CONDITIONS**

### ***2.1 Existing Site***

The existing development consists of agricultural farm field. The total area of the development is approximately 0.92ha.

## 2.2 Road Network Characteristics

The existing road network, lane configuration and existing traffic control for the study area are all under the road authority of the Municipality of Chatham-Kent; and are described below:

**Charing Crossing Road/Queen Street** is a 4-lane arterial roadway with a posted speed limit of 50 km/h. The road runs in a north-south direction and has an urban cross-section. This street provides a connection to Highway 401 on the south of community. There are sidewalks on west of the road right-of-way.

**Indian Creek Road** is a two-lane collector roadway with a posted speed limit of 50 km/h. The road runs in a east-west direction and has an urban cross-section. There is sidewalk on north boulevard of the road right-of-way.

**Lacroix Street** is a two-lane collector roadway with a posted speed limit of 50 km/h. The road runs in the north-south direction. There is sidewalk on east boulevard of the road right-of-way within vicinity of the site. The bicycling lanes are provided on both side of roadway.

## 2.3 Key Intersections

Below provided lane configuration and control type. The following are the key intersections:

### Indian Creek Road West and Charing Cross Road/Queen Street

- The intersection is signalized
- Northbound approach has one left lane and one through-right shared lane.
- Southbound approach has one left lane and one through-right shared lane.
- Eastbound approach has one left lane and one through-right shared lane.
- Westbound approach has one left lane and one through-right shared lane.

### Indian Creek Road West and Lacroix Street

- Northbound approach has one left-through-right shared lane, and “Stop” Control.
- southbound approach has one left-through-right shared lane, and “Stop” Control.
- Eastbound approach has one left-through-right shared lane.

- Westbound approach has one left-through-right shared lane.

## 2.4 Existing Traffic Volumes

Traffic counts were taken at the intersections of Indian Creek Road West with Lacroix Street and Queen Street/Charing Crossing Road on June 22, 2023 by sub-consultant Pyramid Traffic Inc. Counts were recorded in 15-minute increments from 8:00am to 5:30pm. The existing traffic volumes and other relevant data are included in Appendix A.

## 3.0 FUTURE CONDITIONS

### 3.1 Growth Rate

For this study, a conservative growth rate of 2% per year was assumed to reflect growth in background traffic volumes. The projected traffic volumes are provided in Appendix B.

### 3.2 Future Background Development

At this time, there are no new developments in the vicinity of the proposed development, however traffic volumes on adjacent roadways are expected to grow. To reflect an increase in traffic volumes over 10 years, a growth rate of 2 percent is applied as discussed in Section 3.1.

## 4.0 DEVELOPMENT TRAFFIC

This section will describe the development accesses, trip generations, trip distributions and ultimate peak hour traffic.

### 4.1 Development Access

A new access from Indian Creek Road West is proposed for the development. The draft plan is provided in Appendix A and the new intersections have the following configuration:

#### Indian Creek Road West and Access Road 1

- Northbound approach has one left-right shared lane.
- Eastbound approach has one through-right shared lane.
- Westbound approach has one left-through shared lane.

## 4.2 Trip Generation

The Institution of Transportation Engineers (ITE) Trip Generation 9th Edition rates were used to calculate the number of vehicles anticipated to be generated by the proposed development.

The development will consist of 9-Storey Apartment/Condominium with 87 dwelling units. The building footprint area is approximately 1,336.42 m<sup>2</sup>. The ITE Land Use Code 220 – Apartment is best utilized for estimating trips for this development.

Descriptions of land use, ITE codes, unit counts, trip generation rates and trip generations for daily and peak hours are provided in Table 1. Appendix B provides detailed calculations and all relevant charts.

Table 1: Trip Generation

Use	ITE	UNITS	AADT	Trip Generated			
				AM Peak Hour		PM Peak Hour	
		In	Out	In	Out		
<b>Proposed Development</b>							
Apartment Building	220	87	579	9	35	35	19
Total			579	9	35	35	19

## 4.3 Trip Distribution and Assignment

The trip distribution of the proposed development traffic is based on the shortest route to a reach major city i.e., the community of Chatham and City of Windsor. Trip assignment are based on the existing traffic pattern at intersections. The proposed traffic distribution and assignments are shown in Figure 1.2 and Figure 2.2 within Appendix B.

## 4.4 Future Condition

The proposed development traffic volumes were added to the forecasted (2025 and 2035) background traffic volumes to obtain total traffic volumes at intersections. The projected total future volumes are provided in Figure 1.3 and Figure 2.3 within Appendix B.

## 5.0 INTERSECTION OPERATIONS

The forecasted 2025 and 2035 traffic volumes for the analyzed intersections are evaluated using the Synchro/Sim traffic software. The software automates the procedures contained in the Highway Capacity Manual 2010.

The future peak hours analysis results are included in Table 2 and Table 3, and corresponding worksheets are included in Appendix C.

<b>Overall LOS</b>	<b>A</b>			<b>A</b>		

Under 2025 and 2035 future conditions, the intersections are projected to operate at an overall acceptable LOS during peak hours. Based on the results, no mitigation measures are required.

## 6.0 CONCLUSION

Based on our review, we provide the following preliminary comments for the development:

- The proposed development will consist of 9-storey building with 87 dwelling units parking area, loading dock and landscape. The site will generate an additional 579 daily, 44 morning peak and 54 evening peak traffic. The overall area of development is approximately 0.69ha.
  
- The background growth rate of 3 percent was considered in the modelling as it represents the worst-case scenario.

- The proposed development is expected to generate 44 morning trips and 54 evening trips. It is anticipated that will be completed by 2025.
- The access to the development will be provided from Indian Creek Road West. The development access will have "Stop" control.
- Under future conditions, the intersections Indian Creek Road W with Lacroix Street and Charing Cross Road/Queen Street will operate at an overall acceptable level of service during 2025 and 2035 morning and evening peak hours.
- An adequate sight line distance is provided for a safe departure from the development.

In conclusion, the proposed development traffic will have no potential impact on existing intersections. Hence, we believe this assumption is satisfactory to the Municipality. We anticipate no upgrades or changes to the existing intersection's infrastructure will be required.

All of which is respectfully submitted.

## Intersection Summary

Area Type: Other

Cycle Length: 68

Actuated Cycle Length: 38.5

Natural Cycle: 75

Control Type: Semi Act-Uncoord

Maximum v/c Ratio: 0.76

Intersection Signal Delay: 14.8

Intersection LOS: B

Intersection Capacity Utilization 77.9%

ICU Level of Service D

Analysis Period (min) 15

Splits and Phases: 10: Charing Cross Rd /Queen St &amp; Indian Creek Rd W
